

Project Design Phase -II

Data flow Diagram

Parkinson's Disease detection using ML

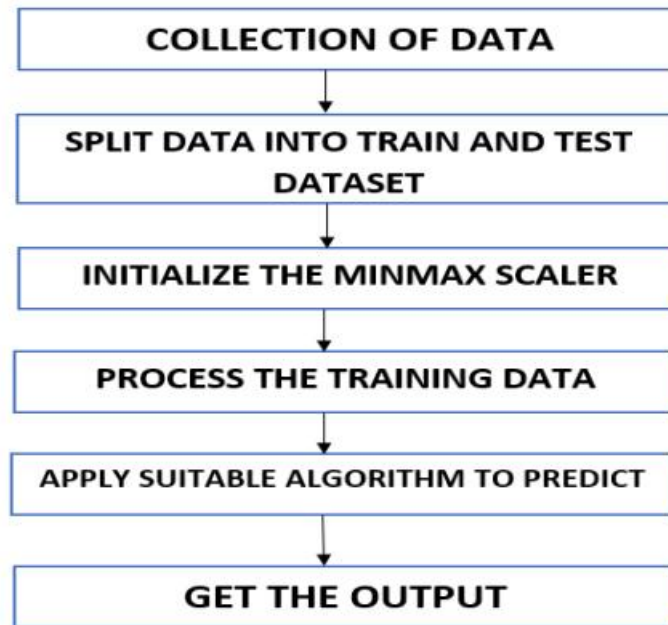

General Detection of PD through medical process:

DATAFLOW DIAGRAM :

The Data flow diagram explains the basic flow data through various steps of Parkinson's disease Detection.

- In the first step we will collect data like from the patient with different medical equipment.
- The collected data is now sent process for training the data which will be classified using different ML algorithms.
- After classification the data into Train and Test datasets, the datasets will be sent to predict whether the patient has the disease or not.

Modules Division :

Let us discuss about the various modules in our proposed system and what each module contributes in achieving our goal.

3.2.1 Speech Dataset:

The main aim of this step is to spot and acquire all data-related problems. during this step, we'd like to spot the various data sources, as data are often collected from various sources like files and databases. The number and quality of the collected data will determine the efficiency of the output. The more are going to be the info, the more accurate are going to be the prediction.

3.2.2 Data Pre-Processing:

The main aim of this step is to study and understand the nature of data that was acquired in the previous step and also to know the quality of data. A real-world data generally contains noises, missing values, and maybe in an unusable format that cannot be directly used for machine learning models. Data pre-processing is a required task for cleaning the data and making it suitable for a machine learning model which also increases the accuracy and efficiency of a machine learning model. Identifying duplicates in the dataset and removing them is also done in this step.

3.2.3 Training data:

Splitting the dataset into Training set and testing set:

In machine learning data preprocessing, we have to break our dataset into both training set and test set. This is often one among the crucial steps of knowledge preprocessing as by doing this, we will enhance the performance of our machine learning model.

Suppose, if we've given training to our machine learning model by a dataset and that we test it by a totally different dataset. Then, it'll create difficulties for our model to know the correlations between the models.

If we train our model alright and its training accuracy is additionally very high, but we offer a replacement dataset there to, then it'll decrease the performance. So we always attempt to make a machine learning model which performs well with the training set and also with the test dataset

3.2.4 Apply Machine Learning Algorithms:

Now, we've both the train and test data. The subsequent step is to spot the possible training methods and train our models. As this is often a classification problem, we've used three different classification methods KNN, Naive Bayes, and Logistic Regression. Each algorithm has been run over the Training dataset and their performance in terms of accuracy is evaluated alongside the prediction wiped out the testing data set.

3.2.5 Testing Data:

Once Parkinson's disease Prediction model has been trained on the pre-processed dataset, then the model is tested using different data points. In this testing step, the model is checked for correctness and accuracy by providing a test dataset to it. All the training methods need to be verified for finding out the best model to be used. after fitting our model with training data, we used this model to predict values for the test dataset. These predicted values on testing data are used for model comparison and accurate calculation.

3.3 User Interface:

Our Front-End implementation is completed using HTML, CSS, JavaScript and Flask Framework in Scientific Python Development Environment (Spyder). The user interface is extremely essential for any project because everyone who tries to utilize the system for a purpose will attempt to access it using an interface. Indeed, our system also features a user interface built to facilitate users to utilize the services we provide. Where we have used HTML a terminology, utilized for creating web sites. One among the useful aspects of HTML is, it can embed programs written during a scripting language like JavaScript, which is liable for affecting the behavior and content of web pages. CSS inclusion would affect the layout and appearance of the content.
